### *Introduction*

Particle physics is a remarkably successful field of scientific inquiry. The ability to precisely predict the properties of a exceedingly wide range of physical phenomena, such as the description of the cosmic microwave background (cite planck) anomalous magnetic moment of the muon (cite paper on this), and the measurement of the number of weakly-interacting neutrino flavors is truly amazing.

The theory that has allowed this range of predictions is the Standard Model of particle physics (SM). The Standard Model combines the electroweak theory of Glashow, Weinberg, and Salam [Weinberg:1967tq, 1, 2] with the theory of the strong interactions, as first envisioned by Gell-Mann and Zweig [GellMann:1964nj, Zweig:1964jf]. This quantum field theory (QFT) contains a tiny number of particles, whose interactions describe phenomena up to at least the TeV scale. These particles are manifestations of the fields of the Standard Model, after application of the Higgs Mechanism. The particle content of the SM consists only of the six quarks, six leptons, the four gauge bosons, and the scalar Higgs boson.

Despite its impressive range of described phenomena, the Standard Model has some theoretical and experimental deficiencies. The SM contains 26 free parameters<sup>1</sup>. It would be more theoretically pleasing to understand these free parameters in terms of a more fundamental theory. The major theoretical concern of the Standard Model, as it pertains to this thesis, is the “hierachy problem”[Weinberg:1979bn , ’tHooft:1979bh, 3–6]. The light mass of the Higgs boson (125 GeV) should be quadratically dependent on the scale of UV physics, due to the quantum corrections

83 from high-energy physics processes. The most perplexing experimental issue is the  
 84 existence of “dark matter”. From cosmological data, it has been shown that there  
 85 exists additional matter which has not yet been seen interacting with the particles of  
 86 the Standard Model. There is no particle in the SM which can act as a candidate for  
 87 dark matter.

88 Both of these major issues, as well as numerous others, can be solved by the  
 89 introduction of “supersymmetry”. In supersymmetric theories, all particles have a  
 90 so-called “superpartners”, or sparticles, differing from the particle by 1/2 in spin.  
 91 These theories solve the hierarchy problem, since the corrections induced from the  
 92 superpartners exactly cancel those induced by the SM particles. In addition, these  
 93 theories are usually constructed assuming  $R$ -parity, which can be thought of as the  
 94 “charge” of supersymmetry, with SM particles having  $R = 1$  and sparticles having  
 95  $R = -1$ . In collider experiments, since the incoming SM particles have total  $R = 1$ ,  
 96 the resulting sparticles are produced in pairs. This produces a rich phenomenology,  
 97 which is often characterized by large missing transverse energy ( $E_T^{\text{miss}}$ ), which provides  
 98 significant discrimination against SM backgrounds.

99 Despite the power of searches for supersymmetry where  $E_T^{\text{miss}}$  is a primary dis-  
 100 criminating variable, there has been significant interest in the use of other variables  
 101 to discriminate against SM backgrounds. These include searches employing variables  
 102 such as  $\alpha_{\text{something}}$ ,  $M_{T,2}$ , and the razor variables ( $M_R, R^2$ ). In this thesis, we will  
 103 present the first search for supersymmetry using the novel Recursive Jigsaw Recon-  
 104 struction (RJR) technique. RJR can be considered the conceptual successor of the  
 105 razor variables. We impose a particular final state “decay tree” on an event, which  
 106 roughly corresponds to a simplified Feynmann diagram. This allows an understand-

---

<sup>1</sup>This is the Standard Model corrected to include neutrino masses. These parameters are the fermion masses (6 leptons, 6 quarks), CKM and PMNS mixing angles (8 angles, 2 CP-violating phases), W/Z/Higgs masses (3), the Higgs field expectation value, and the couplings of the strong, weak, and electromagnetic forces (3  $\alpha_{\text{force}}$ ).

107 ing of internal decay structure of an event, as well as additional rejection of SM  
108 backgrounds.

109 This thesis details a search for the superpartners of the gluons and quarks, the  
110 gluinos and squarks, in final states with zero leptons, with of data using the AT-  
111 LAS detector. This thesis is organized as follows. The theoretical motivation of the  
112 Standard Model and supersymmetry are described in Chapters 2 and 3. The Large  
113 Hadron Collider and the ATLAS detector are presented in Chapters 4 and 5. Chap-  
114 ter 5 provides a detailed description of Recursive Jigsaw Reconstruction, as well as  
115 a description of the variables used for the particular search presented in this thesis.  
116 Chapter 6 presents the details of the analysis, including the dataset, object recon-  
117 struction, and selections used by the analysis. In Chapter 7, the final results are  
118 presented; since there is no evidence of a supersymmetric signal in the analysis, we  
119 present the final exclusion curves in simplified supersymmetric models.

## Chapter 2

121

---

### *The Standard Model*

122 Here you can write some introductory remarks about your chapter. I like to give each  
123 sentence its own line.

124 When you need a new paragraph, just skip an extra line.

## 125 **2.1 Quantum Field Theory**

## 126 **2.2 Symmetries**

## 127 **2.3 The Standard Model**

### 128 **Overview**

129 By using the asterisk to start a new section, I keep the section from appearing in the  
130 table of contents. If you want your sections to be numbered and to appear in the  
131 table of contents, remove the asterisk.

### 132 **Fermions**

133 By using the asterisk to start a new section, I keep the section from appearing in the  
134 table of contents. If you want your sections to be numbered and to appear in the  
135 table of contents, remove the asterisk.

## 136 **Bosons**

137 By using the asterisk to start a new section, I keep the section from appearing in the  
138 table of contents. If you want your sections to be numbered and to appear in the  
139 table of contents, remove the asterisk.

## 140 **2.4 Electroweak Symmetry breaking**

141 By using the asterisk to start a new section, I keep the section from appearing in the  
142 table of contents. If you want your sections to be numbered and to appear in the  
143 table of contents, remove the asterisk.

## 144 **2.5 Deficiencies of the Standard Model**

145 By using the asterisk to start a new section, I keep the section from appearing in the  
146 table of contents. If you want your sections to be numbered and to appear in the  
147 table of contents, remove the asterisk.

148

## Chapter 3

149

---

### *Supersymmetry*

150 Here you can write some introductory remarks about your chapter. I like to give each  
151 sentence its own line.

152     When you need a new paragraph, just skip an extra line.

### 153 **3.1 Motivation**

154 **Only Additional allowed Lorentz invariant symmetry**

155 **Dark Matter**

156 **Cancellation of quadratic divergences in corrections to the**

157 **Higgs Mass**

### 158 **3.2 Supersymmetry**

### 159 **3.3 Additional particle content**

### 160 **3.4 Phenomenology**

161 **R parity Consequences for sq/gl decays**

162

## Chapter 4

163

---

### *The Large Hadron Collider*

164 Here you can write some introductory remarks about your chapter. I like to give each  
165 sentence its own line.

166     When you need a new paragraph, just skip an extra line.

#### 167 **4.1 Magnets**

168 By using the asterisk to start a new section, I keep the section from appearing in the  
169 table of contents. If you want your sections to be numbered and to appear in the  
170 table of contents, remove the asterisk.

171

## Chapter 5

172

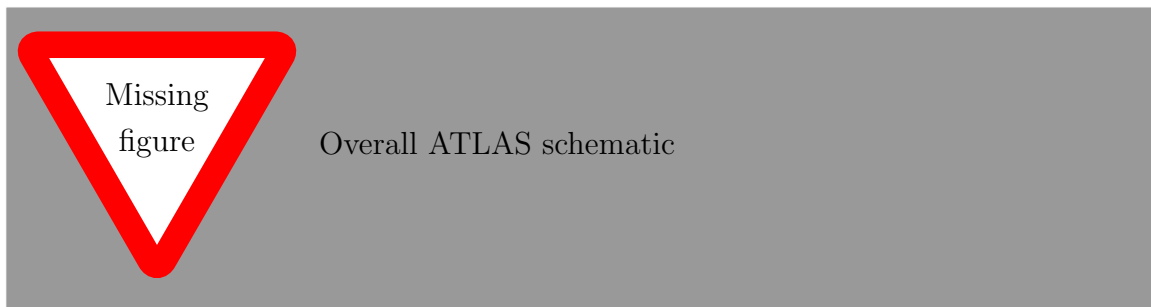

---

### *The ATLAS detector*

173 Here you can write some introductory remarks about your chapter. I like to give each  
174 sentence its own line.

175 When you need a new paragraph, just skip an extra line.

176

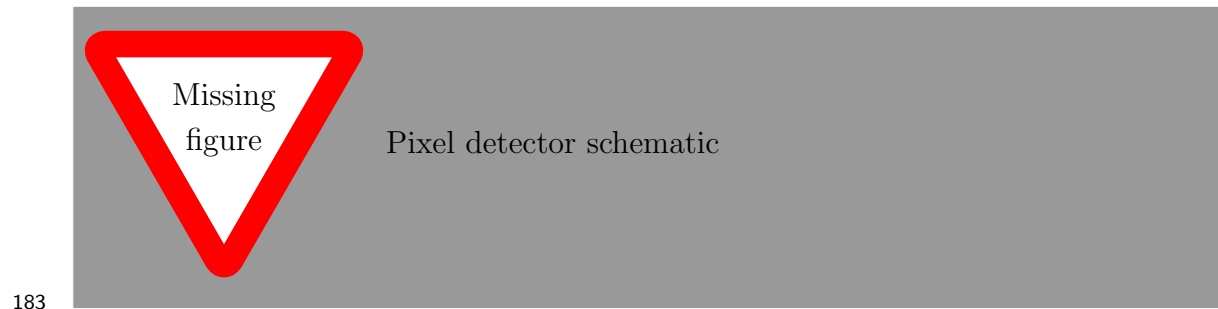

177

## 178 **5.1 Inner Detector**

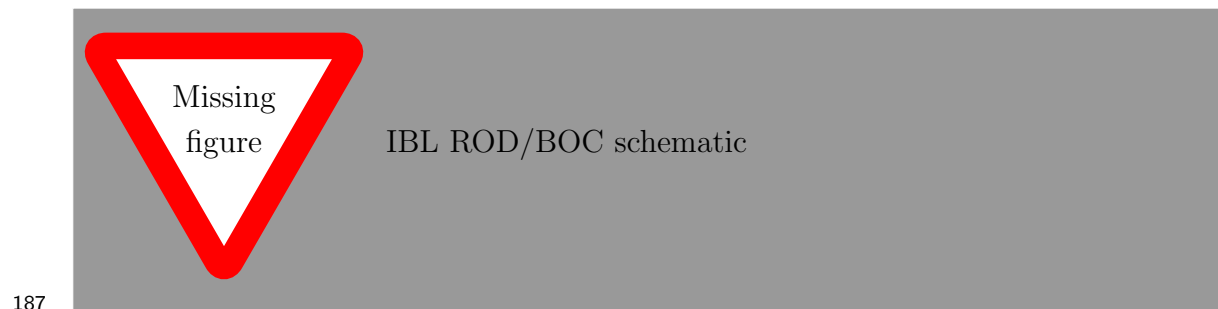

179 By using the asterisk to start a new section, I keep the section from appearing in the  
180 table of contents. If you want your sections to be numbered and to appear in the  
181 table of contents, remove the asterisk.

182 **Pixel Detector**

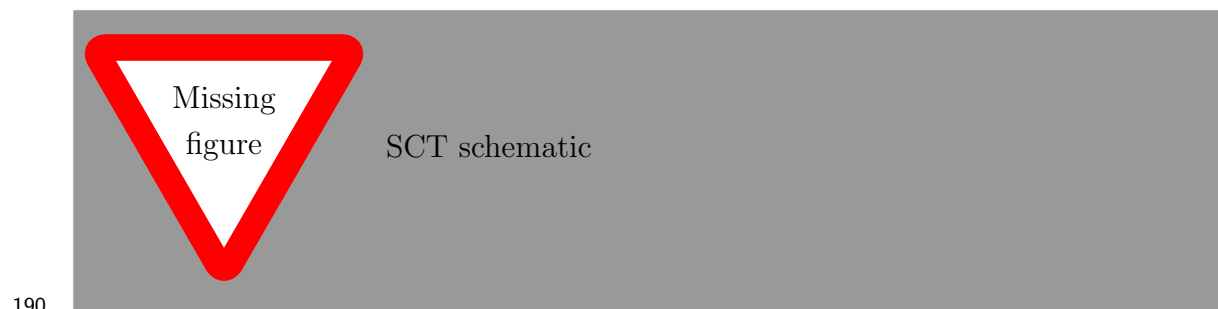

185 **Insertable B-Layer**

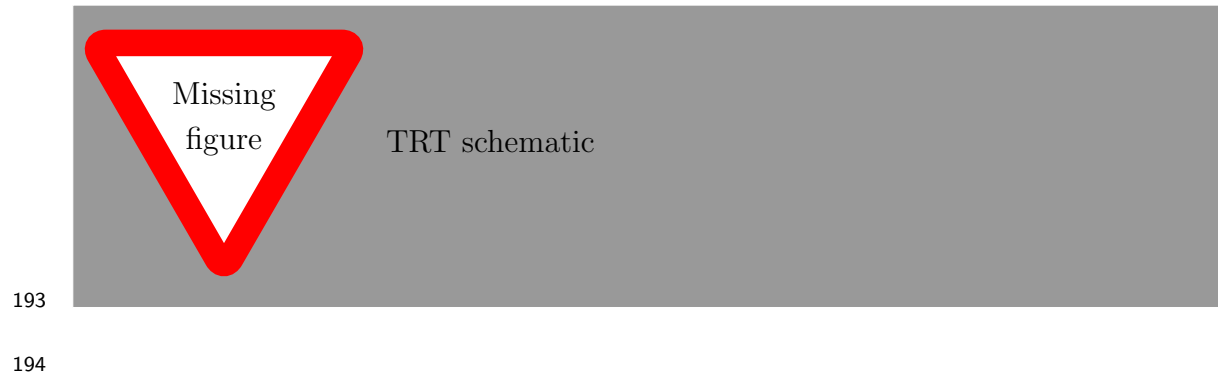

186 Qualification task, so add a bit more.

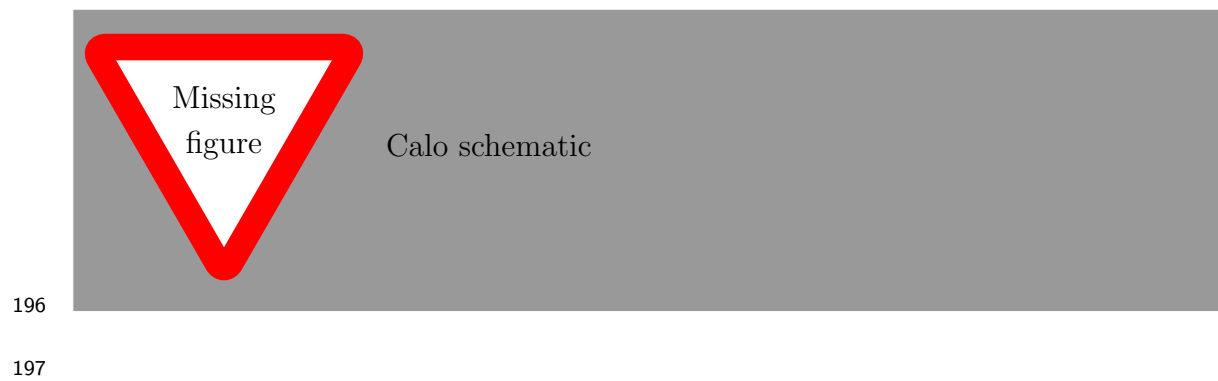

189 **Semiconductor Tracker**

192 **Transition Radiation Tracker**

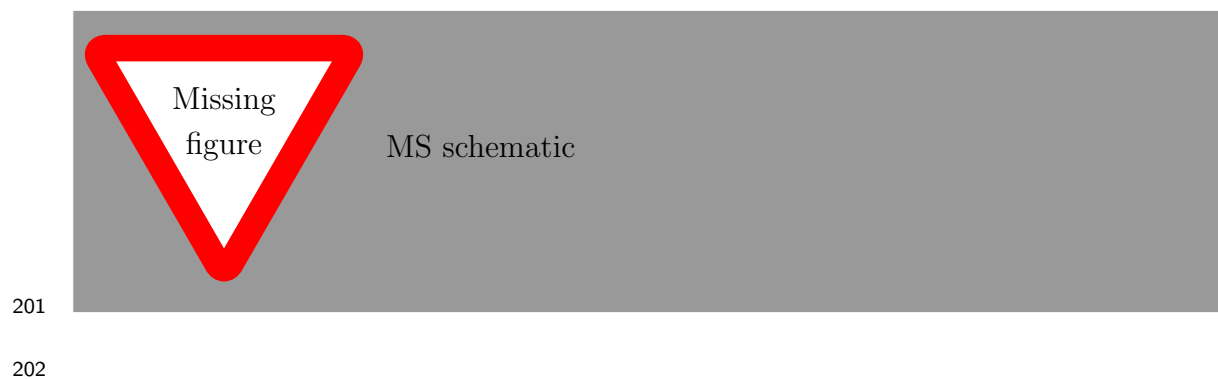

195 **5.2 Calorimeter**

198 **Electromagnetic Calorimeter**

199 **Hadronic Calorimeter**

200 **5.3 Muon Spectrometer**

203

## Chapter 6

204

---

### *The Recursive Jigsaw Technique*

205 Here you can write some introductory remarks about your chapter. I like to give each  
206 sentence its own line.

207     When you need a new paragraph, just skip an extra line.

#### 208 **6.1   Razor variables**

209 By using the asterisk to start a new section, I keep the section from appearing in the  
210 table of contents. If you want your sections to be numbered and to appear in the  
211 table of contents, remove the asterisk.

#### 212 **6.2   SuperRazor variables**

#### 213 **6.3   The Recursive Jigsaw Technique**

#### 214 **6.4   Variables used in the search for zero lepton** 215 **SUSY**

---

*Title of Chapter 1*

218

## Chapter 8

219

---

### *Title of Chapter 1*

220 Here you can write some introductory remarks about your chapter. I like to give each  
221 sentence its own line.

222 When you need a new paragraph, just skip an extra line.

## 223 **8.1 Object reconstruction**

### 224 **Photons, Muons, and Electrons**

### 225 **Jets**

### 226 **Missing transverse momentum**

227 Probably longer, show some plots from the PUB note that we worked on

## 228 **8.2 Signal regions**

229 **Gluino signal regions**

230 **Squark signal regions**

231 **Compressed signal regions**

## 232 **8.3 Background estimation**

233 **Z  $\nu\nu$**

234 **W  $e\nu$**

235  **$t\bar{t}$**

236

## Chapter 9

237

---

### *Title of Chapter 1*

238 Here you can write some introductory remarks about your chapter. I like to give each  
239 sentence its own line.

240 When you need a new paragraph, just skip an extra line.

### 241 **9.1 Statistical Analysis**

242 maybe to be moved to an appendix

### 243 **9.2 Signal Region distributions**

### 244 **9.3 Pull Plots**

### 245 **9.4 Systematic Uncertainties**

### 246 **9.5 Exclusion plots**

247

---

## *Conclusion*

248 Here you can write some introductory remarks about your chapter. I like to give each  
249 sentence its own line.

250 When you need a new paragraph, just skip an extra line.

## 251 **9.6 New Section**

252 By using the asterisk to start a new section, I keep the section from appearing in the  
253 table of contents. If you want your sections to be numbered and to appear in the  
254 table of contents, remove the asterisk.
