Chapter 1

Introduction

Particle physics is a remarkably successful field of scientific inquiry. The ability to precisely predict the properties of a exceedingly wide range of physical phenomena, such as the description of the cosmic microwave background (cite planck) anomalous magnetic moment of the muon (cite paper on this), and the measurement of the number of weakly-interacting neutrino flavors is truly amazing.

The theory that has allowed this range of predictions is the Standard Model of particle physics (SM). The Standard Model combines the electroweak theory of Glashow, Weinberg, and Salam [1–3] with the theory of the strong interactions, as first envisioned by Gell-Mann and Zweig [4, 5]. This quantum field theory (QFT) contains a tiny number of particles, whose interactions describe phenomena up to at least the TeV scale. These particles are manifestations of the fields of the Standard Model, after application of the Higgs Mechanism. The particle content of the SM consists only of the six quarks, six leptons, the four gauge bosons, and the scalar Higgs boson.

Despite its impressive range of described phenomena, the Standard Model has some theoretical and experimental deficiencies. The SM contains 26 free parameters¹. It would be more theoretically pleasing to understand these free parameters in terms of a more fundamental theory. The major theoretical concern of the Standard Model, as it pertains to this thesis, is the “hierachy problem”[6–10]. The light mass of the Higgs boson (125 GeV) should be quadratically dependent on the scale of UV physics, due to the quantum corrections from high-energy physics processes. The most

perplexing experimental issue is the existence of “dark matter”, as demonstrated by galactic rotation curves [11–17]. From cosmological data, it has been shown that there exists additional matter which has not yet been seen interacting with the particles of the Standard Model. There is no particle in the SM which can act as a candidate for dark matter.

Both of these major issues, as well as numerous others, can be solved by the introduction of “supersymmetry” [10, 18–28]. In supersymmetric theories, each SM particles has a so-called “superpartner”, or sparticle partner, differing from given SM particle by $1/2$ in spin. These theories solve the hierarchy problem, since the quantum corrections induced from the superpartners exactly cancel those induced by the SM particles. In addition, these theories are usually constructed assuming R -parity, which can be thought of as the “charge” of supersymmetry, with SM particles having $R = 1$ and sparticles having $R = -1$. In collider experiments, since the incoming SM particles have total $R = 1$, the resulting sparticles are produced in pairs. This produces a rich phenomenology, which is often characterized by large missing transverse energy (E_T^{miss}), which provides significant discrimination against SM backgrounds [29].

Despite the power of searches for supersymmetry where E_T^{miss} is a primary discriminating variable, there has been significant interest in the use of other variables to discriminate against SM backgrounds. These include searches employing variables such as αT , $M_{T,2}$, and the razor variables (M_R, R^2) [30–40]. In this thesis, we will present the first search for supersymmetry using the novel Recursive Jigsaw Reconstruction (RJR) technique. RJR can be considered the conceptual successor of the razor variables. We impose a particular final state “decay tree” on an event, which

¹This is the Standard Model corrected to include neutrino masses. These parameters are the fermion masses (6 leptons, 6 quarks), CKM and PMNS mixing angles (8 angles, 2 CP-violating phases), W/Z/Higgs masses (3), the Higgs field expectation value, and the couplings of the strong, weak, and electromagnetic forces (3 α_{force}).

roughly corresponds to a simplified Feynmann diagram. This allows an understanding of internal decay structure of an event, as well as additional rejection of SM backgrounds.

This thesis details a search for the superpartners of the gluons and quarks, the gluinos and squarks, in final states with zero leptons, with of data using the ATLAS detector. This thesis is organized as follows. The theoretical motivation of the Standard Model and supersymmetry are described in Chapters 2 and 3. The Large Hadron Collider and the ATLAS detector are presented in Chapters 4 and 5. Chapter 5 provides a detailed description of Recursive Jigsaw Reconstruction, as well as a description of the variables used for the particular search presented in this thesis. Chapter 6 presents the details of the analysis, including the dataset, object reconstruction, and selections used by the analysis. In Chapter 7, the final results are presented; since there is no evidence of a supersymmetric signal in the analysis, we present the final exclusion curves in simplified supersymmetric models.

Chapter 2

122

The Standard Model

123 Here you can write some introductory remarks about your chapter. I like to give each
124 sentence its own line.

125 When you need a new paragraph, just skip an extra line.

126 **2.1 Quantum Field Theory**

127 **2.2 Symmetries**

128 **2.3 The Standard Model**

129 **Overview**

130 By using the asterisk to start a new section, I keep the section from appearing in the
131 table of contents. If you want your sections to be numbered and to appear in the
132 table of contents, remove the asterisk.

133 **Fermions**

134 By using the asterisk to start a new section, I keep the section from appearing in the
135 table of contents. If you want your sections to be numbered and to appear in the
136 table of contents, remove the asterisk.

137 **Bosons**

138 By using the asterisk to start a new section, I keep the section from appearing in the
139 table of contents. If you want your sections to be numbered and to appear in the
140 table of contents, remove the asterisk.

141 **2.4 Electroweak Symmetry breaking**

142 By using the asterisk to start a new section, I keep the section from appearing in the
143 table of contents. If you want your sections to be numbered and to appear in the
144 table of contents, remove the asterisk.

145 **2.5 Deficiencies of the Standard Model**

146 By using the asterisk to start a new section, I keep the section from appearing in the
147 table of contents. If you want your sections to be numbered and to appear in the
148 table of contents, remove the asterisk.

149

Chapter 3

150

Supersymmetry

151 Here you can write some introductory remarks about your chapter. I like to give each
152 sentence its own line.

153 When you need a new paragraph, just skip an extra line.

154 **3.1 Motivation**

155 **Only Additional allowed Lorentz invariant symmetry**

156 **Dark Matter**

157 **Cancellation of quadratic divergences in corrections to the**

158 **Higgs Mass**

159 **3.2 Supersymmetry**

160 **3.3 Additional particle content**

161 **3.4 Phenomenology**

162 **R parity Consequences for sq/gl decays**

The Large Hadron Collider

165 Here you can write some introductory remarks about your chapter. I like to give each
166 sentence its own line.

167 When you need a new paragraph, just skip an extra line.

168 **4.1 Magnets**

169 By using the asterisk to start a new section, I keep the section from appearing in the
170 table of contents. If you want your sections to be numbered and to appear in the
171 table of contents, remove the asterisk.

172

205

The Recursive Jigsaw Technique

206 Here you can write some introductory remarks about your chapter. I like to give each
207 sentence its own line.

208 When you need a new paragraph, just skip an extra line.

209 **6.1 Razor variables**

210 By using the asterisk to start a new section, I keep the section from appearing in the
211 table of contents. If you want your sections to be numbered and to appear in the
212 table of contents, remove the asterisk.

213 **6.2 SuperRazor variables**

214 **6.3 The Recursive Jigsaw Technique**

215 **6.4 Variables used in the search for zero lepton**

216 **SUSY**

Title of Chapter 1

219

Chapter 8

220

Title of Chapter 1

221 Here you can write some introductory remarks about your chapter. I like to give each
222 sentence its own line.

223 When you need a new paragraph, just skip an extra line.

224 **8.1 Object reconstruction**

225 **Photons, Muons, and Electrons**

226 **Jets**

227 **Missing transverse momentum**

228 Probably longer, show some plots from the PUB note that we worked on

229 **8.2 Signal regions**

230 **Gluino signal regions**

231 **Squark signal regions**

232 **Compressed signal regions**

233 **8.3 Background estimation**

234 **Z $\nu\nu$**

235 **W $e\nu$**

236 **$t\bar{t}$ bar**

237

Chapter 9

238

Title of Chapter 1

239 Here you can write some introductory remarks about your chapter. I like to give each
240 sentence its own line.

241 When you need a new paragraph, just skip an extra line.

242 **9.1 Statistical Analysis**

243 maybe to be moved to an appendix

244 **9.2 Signal Region distributions**

245 **9.3 Pull Plots**

246 **9.4 Systematic Uncertainties**

247 **9.5 Exclusion plots**

248

Conclusion

249 Here you can write some introductory remarks about your chapter. I like to give each
250 sentence its own line.

251 When you need a new paragraph, just skip an extra line.

252 **9.6 New Section**

253 By using the asterisk to start a new section, I keep the section from appearing in the
254 table of contents. If you want your sections to be numbered and to appear in the
255 table of contents, remove the asterisk.
