Introduction

Particle physics is a remarkably successful field of scientific inquiry. The ability to precisely predict the properties of a exceedingly wide range of physical phenomena, such as the description of the cosmic microwave background [1, 2], the understanding of the anomalous magnetic dipole moment of the electron [3, 4], and the measurement of the number of weakly-interacting neutrino flavors [5] is truly amazing.

The theory that has allowed this range of predictions is the *Standard Model* of particle physics (SM). The Standard Model combines the electroweak theory of Glashow, Weinberg, and Salam [6–8] with the theory of the strong interactions, as first envisioned by Gell-Mann and Zweig [9, 10]. This quantum field theory (QFT) contains a tiny number of particles, whose interactions describe phenomena up to at least the TeV scale. These particles are manifestations of the fields of the Standard Model, after application of the Higgs Mechanism. The particle content of the SM consists only of the six quarks, the six leptons, the four gauge bosons, and the scalar Higgs boson.

Despite its impressive range of described phenomena, the Standard Model has some theoretical and experimental deficiencies. The SM contains 26 free parameters¹. It would be more theoretically pleasing to understand these free parameters in terms of a more fundamental theory. The major theoretical concern of the Standard Model, as it pertains to this thesis, is the *hierachy problem*[11–15]. The light mass

¹This is the Standard Model corrected to include neutrino masses. These parameters are the fermion masses (6 leptons, 6 quarks), CKM and PMNS mixing angles (8 angles, 2 CP-violating phases), W/Z/Higgs masses (3), the Higgs field expectation value, and the couplings of the strong, weak, and electromagnetic forces (3 α_{force}) .

81 of the Higgs boson (125 GeV) should be quadratically dependent on the scale of
 82 UV physics, due to the quantum corrections from high-energy physics processes. The
 83 most perplexing experimental issue is the existence of *dark matter*, as demonstrated by
 84 galactic rotation curves [16–22]. From cosmological data, it has been shown that there
 85 exists additional matter which has not yet been seen interacting with the particles of
 86 the Standard Model. There is no particle in the SM which can act as a candidate for
 87 dark matter.

88 Both of these major issues, as well as numerous others, can be solved by the in-
 89 troduction of *supersymmetry* (SUSY) [15, 23–33]. In supersymmetric theories, each
 90 SM particle has a so-called *superpartner*, or sparticle partner, differing from given
 91 SM particle by 1/2 in spin. These theories solve the hierarchy problem, since the
 92 quantum corrections induced from the superpartners exactly cancel those induced
 93 by the SM particles. In addition, these theories are usually constructed assuming
 94 R -parity, which can be thought of as the “charge” of supersymmetry, with SM par-
 95 ticles having $R = 1$ and sparticles having $R = -1$. In collider experiments, since
 96 the incoming SM particles have total $R = 1$, the resulting sparticles are produced
 97 in pairs. This produces a rich phenomenology, which is often characterized by sig-
 98 nificant hadronic activity and large missing transverse energy (E_T^{miss}), which provide
 99 significant discrimination against SM backgrounds [34].

100 Despite the power of searches for supersymmetry where E_T^{miss} is a primary dis-
 101 criminating variable, there has been significant interest in the use of other variables
 102 to discriminate against SM backgrounds. These include searches employing variables
 103 such as αT , $M_{T,2}$, and the razor variables (M_R, R^2) [35–45]. In this thesis, we will
 104 present the first search for supersymmetry using the novel Recursive Jigsaw Recon-
 105 struction (RJR) technique. RJR can be considered the conceptual successor of the
 106 razor variables. We impose a particular final state “decay tree” on an event, which
 107 roughly corresponds to a simplified Feynmann diagram in decays containing weakly-

108 interacting particles. We account for the missing degrees of freedom associated to
109 the weakly-interacting particles by a series of simplifying assumptions, which allow
110 us to calculate our variables of interest at each step in the decay tree. This allows an
111 unprecedented understanding of the internal structure of the decay and the ability to
112 construct additional variables to reject Standard Model backgrounds.

113 This thesis details a search for the superpartners of the gluon and quarks, the
114 gluino and squarks, in final states with zero leptons, with 13.3 fb^{-1} of data using the
115 ATLAS detector. We organize the thesis as follows. The theoretical foundations of
116 the Standard Model and supersymmetry are described in Chapters 2 and 3. The
117 Large Hadron Collider and the ATLAS detector are presented in Chapters 4 and 5.
118 Chapter 5 provides a detailed description of Recursive Jigsaw Reconstruction and a
119 description of the variables used for the particular search presented in this thesis.
120 Chapter 6 presents the details of the analysis, including details of the dataset, object
121 reconstruction, and selections used. In Chapter 7, the final results are presented;
122 since there is no evidence of a supersymmetric signal in the analysis, we present the
123 final exclusion curves in simplified supersymmetric models.

124

Chapter 2

125

The Standard Model

126 Here you can write some introductory remarks about your chapter. I like to give each
127 sentence its own line.

128 When you need a new paragraph, just skip an extra line.

129 **2.1 Quantum Field Theory**

130 **2.2 Symmetries**

131 **2.3 The Standard Model**

132 **Overview**

133 By using the asterisk to start a new section, I keep the section from appearing in the
134 table of contents. If you want your sections to be numbered and to appear in the
135 table of contents, remove the asterisk.

136 **Fermions**

137 By using the asterisk to start a new section, I keep the section from appearing in the
138 table of contents. If you want your sections to be numbered and to appear in the
139 table of contents, remove the asterisk.

140 **Bosons**

141 By using the asterisk to start a new section, I keep the section from appearing in the
142 table of contents. If you want your sections to be numbered and to appear in the
143 table of contents, remove the asterisk.

144 **2.4 Electroweak Symmetry breaking**

145 By using the asterisk to start a new section, I keep the section from appearing in the
146 table of contents. If you want your sections to be numbered and to appear in the
147 table of contents, remove the asterisk.

148 **2.5 Deficiencies of the Standard Model**

149 By using the asterisk to start a new section, I keep the section from appearing in the
150 table of contents. If you want your sections to be numbered and to appear in the
151 table of contents, remove the asterisk.

152

Chapter 3

153

Supersymmetry

154 Here you can write some introductory remarks about your chapter. I like to give each
155 sentence its own line.

156 When you need a new paragraph, just skip an extra line.

157 **3.1 Motivation**

158 **Only Additional allowed Lorentz invariant symmetry**

159 **Dark Matter**

160 **Cancellation of quadratic divergences in corrections to the**

161 **Higgs Mass**

162 **3.2 Supersymmetry**

163 **3.3 Additional particle content**

164 **3.4 Phenomenology**

165 **R parity Consequences for sq/gl decays**

The Large Hadron Collider

168 Here you can write some introductory remarks about your chapter. I like to give each
169 sentence its own line.

170 When you need a new paragraph, just skip an extra line.

171 **4.1 Magnets**

172 By using the asterisk to start a new section, I keep the section from appearing in the
173 table of contents. If you want your sections to be numbered and to appear in the
174 table of contents, remove the asterisk.

175

Chapter 5

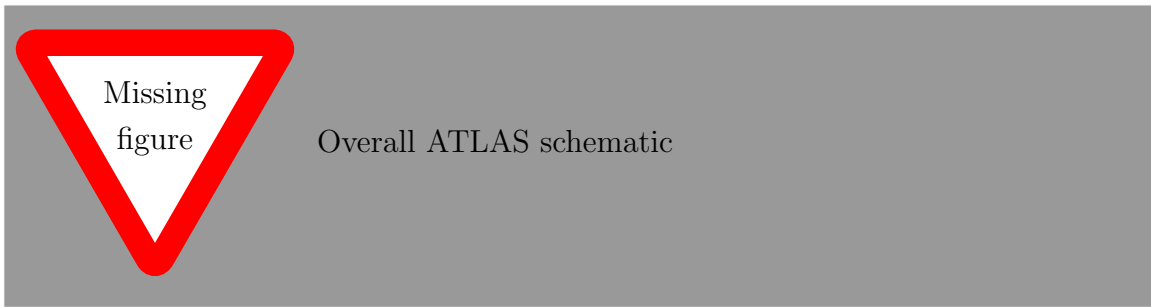

176

The ATLAS detector

177 Here you can write some introductory remarks about your chapter. I like to give each
178 sentence its own line.

179 When you need a new paragraph, just skip an extra line.

180

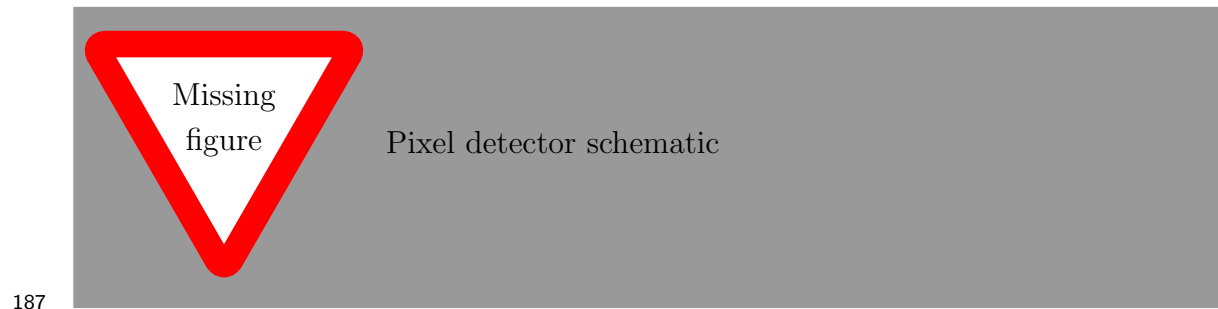

181

182 **5.1 Inner Detector**

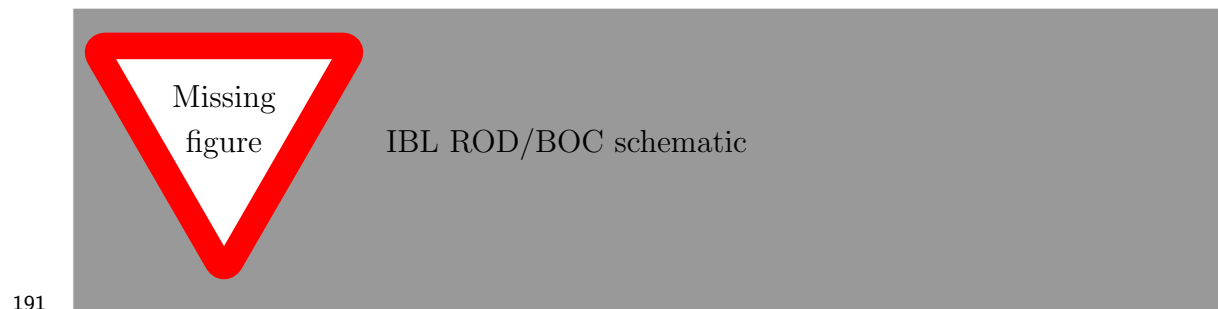

183 By using the asterisk to start a new section, I keep the section from appearing in the
184 table of contents. If you want your sections to be numbered and to appear in the
185 table of contents, remove the asterisk.

186 **Pixel Detector**

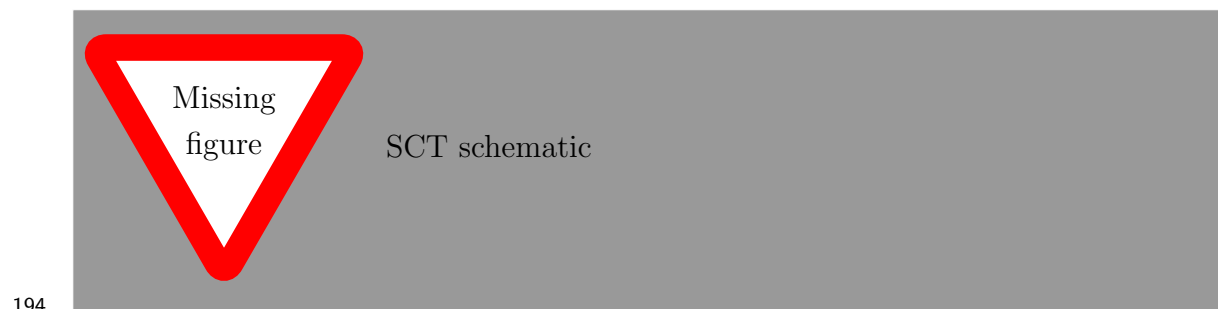

189 **Insertable B-Layer**

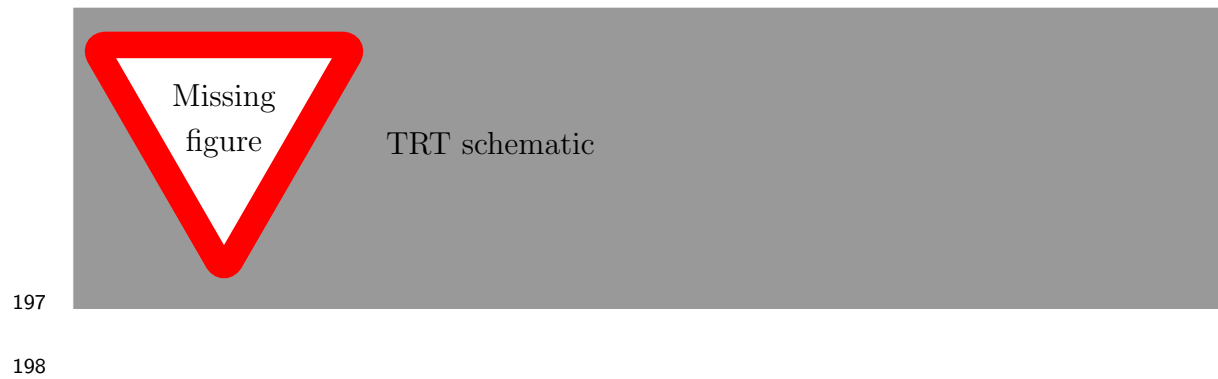

190 Qualification task, so add a bit more.

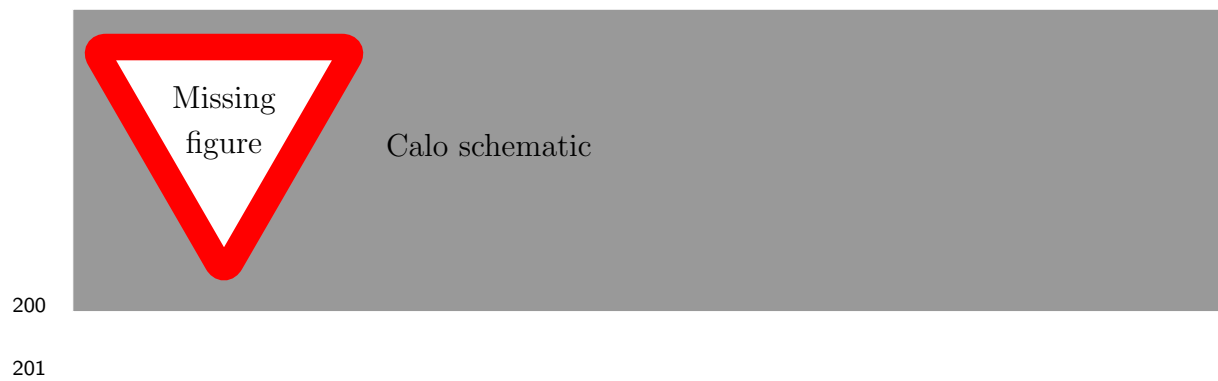

193 **Semiconductor Tracker**

196 **Transition Radiation Tracker**

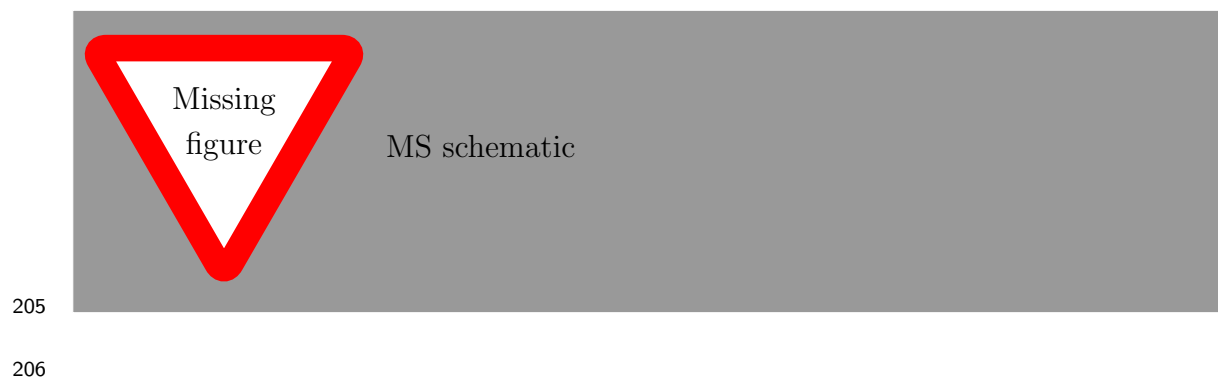

199 **5.2 Calorimeter**

202 **Electromagnetic Calorimeter**

203 **Hadronic Calorimeter**

204 **5.3 Muon Spectrometer**

207

Chapter 6

208

The Recursive Jigsaw Technique

209 Here you can write some introductory remarks about your chapter. I like to give each
210 sentence its own line.

211 When you need a new paragraph, just skip an extra line.

212 **6.1 Razor variables**

213 By using the asterisk to start a new section, I keep the section from appearing in the
214 table of contents. If you want your sections to be numbered and to appear in the
215 table of contents, remove the asterisk.

216 **6.2 SuperRazor variables**

217 **6.3 The Recursive Jigsaw Technique**

218 **6.4 Variables used in the search for zero lepton**

219 **SUSY**

Title of Chapter 1

222

Chapter 8

223

Title of Chapter 1

224 Here you can write some introductory remarks about your chapter. I like to give each
225 sentence its own line.

226 When you need a new paragraph, just skip an extra line.

227 **8.1 Object reconstruction**

228 **Photons, Muons, and Electrons**

229 **Jets**

230 **Missing transverse momentum**

231 Probably longer, show some plots from the PUB note that we worked on

232 **8.2 Signal regions**

233 **Gluino signal regions**

234 **Squark signal regions**

235 **Compressed signal regions**

236 **8.3 Background estimation**

237 **Z $\nu\nu$**

238 **W $e\nu$**

239 **$t\bar{t}$**

240

Chapter 9

241

Title of Chapter 1

242 Here you can write some introductory remarks about your chapter. I like to give each
243 sentence its own line.

244 When you need a new paragraph, just skip an extra line.

245 **9.1 Statistical Analysis**

246 maybe to be moved to an appendix

247 **9.2 Signal Region distributions**

248 **9.3 Pull Plots**

249 **9.4 Systematic Uncertainties**

250 **9.5 Exclusion plots**

251

Conclusion

252 Here you can write some introductory remarks about your chapter. I like to give each
253 sentence its own line.

254 When you need a new paragraph, just skip an extra line.

255 **9.6 New Section**

256 By using the asterisk to start a new section, I keep the section from appearing in the
257 table of contents. If you want your sections to be numbered and to appear in the
258 table of contents, remove the asterisk.
