### *Introduction*

Particle physics is a remarkably successful field of scientific inquiry. The ability to precisely predict the properties of a exceedingly wide range of physical phenomena, such as the description of the cosmic microwave background (cite planck) anomalous magnetic moment of the muon (cite paper on this), and the measurement of the number of weakly-interacting neutrino flavors is truly amazing.

The theory that has allowed this range of predictions is the Standard Model of particle physics (SM). The Standard Model combines the electroweak theory of Glashow, Weinberg, and Salam [**Weinberg:1967tq**, 1, 2] with the theory of the strong interactions, as first envisioned by Gell-Mann and Zweig [**GellMann:1964nj**, **Zweig:1964jf**]. This quantum field theory (QFT) contains a tiny number of particles, whose interactions describe phenomena up to at least the TeV scale. These particles are manifestations of the fields of the Standard Model, after application of the Higgs Mechanism. The particle content of the SM consists only of the six quarks, six leptons, the four gauge bosons, and the scalar Higgs boson.

Despite its impressive range of described phenomena, the Standard Model has some theoretical and experimental deficiencies. The SM contains 26 free parameters<sup>1</sup>. It would be more theoretically pleasing to understand these free parameters in terms of a more fundamental theory. The major theoretical concern of the Standard Model, as it pertains to this thesis, is the “hierachy problem” [**Weinberg:1979bn**, 3–6]. The light mass of the Higgs boson (125 GeV) should be quadratically dependent on the scale of UV physics, due to the quantum corrections from high-energy physics

83 processes. The most perplexing experimental issue is the existence of “dark matter”,  
 84 as demonstrated by galactic rotation curves [**darkMatterPrimer** , 7–12]. From  
 85 cosmological data, it has been shown that there exists additional matter which has  
 86 not yet been seen interacting with the particles of the Standard Model. There is no  
 87 particle in the SM which can act as a candidate for dark matter.

88 Both of these major issues, as well as numerous others, can be solved  
 89 by the introduction of “supersymmetry” [**Gervais:1971xj** , **Golfand:1971iw** ,  
 90 **Volkov:1973ix** , **Ferrara:1974ac** , 6, 13–19]. In supersymmetric theories, each  
 91 SM particles has a so-called “superpartner”, or sparticle partner, differing from given  
 92 SM particle by  $1/2$  in spin. These theories solve the hierachy problem, since the  
 93 quantum corrections induced from the superpartners exactly cancel those induced  
 94 by the SM particles. In addition, these theories are usually constructed assuming  
 95  $R$ –parity, which can be thought of as the “charge” of supersymmetry, with SM par-  
 96 ticles having  $R = 1$  and sparticles having  $R = -1$ . In collider experiments, since  
 97 the incoming SM particles have total  $R = 1$ , the resulting sparticles are produced  
 98 in pairs. This produces a rich phenomenology, which is often characterized by large  
 99 missing transverse energy ( $E_T^{\text{miss}}$ ), which provides significant discrimination against  
 100 SM backgrounds [20].

101 Despite the power of searches for supersymmetry where  $E_T^{\text{miss}}$  is a primary dis-  
 102 criminating variable, there has been significant interest in the use of other vari-  
 103 ables to discriminate against SM backgrounds. These include searches employing  
 104 variables such as  $\alpha T$ ,  $M_{T,2}$ , and the razor variables ( $M_R, R^2$ ) [**SUSY-2014-06** ,  
 105 **ATLAS-CONF-2016-009** , 21–31]. In this thesis, we will present the first search  
 106 for supersymmetry using the novel Recursive Jigsaw Reconstruction (RJR) technique.

---

<sup>1</sup>This is the Standard Model corrected to include neutrino masses. These parameters are the fermion masses (6 leptons, 6 quarks), CKM and PMNS mixing angles (8 angles, 2 CP-violating phases), W/Z/Higgs masses (3) , the Higgs field expectation value, and the couplings of the strong, weak, and electromagnetic forces (3  $\alpha_{\text{force}}$  ) .

107 RJR can be considered the conceptual successor of the razor variables. We impose a  
108 particular final state “decay tree” on an event, which roughly corresponds to a sim-  
109 plified Feynmann diagram. This allows an understanding of internal decay structure  
110 of an event, as well as additional rejection of SM backgrounds.

111 This thesis details a search for the superpartners of the gluons and quarks, the  
112 gluinos and squarks, in final states with zero leptons, with of data using the AT-  
113 LAS detector. This thesis is organized as follows. The theoretical motivation of the  
114 Standard Model and supersymmetry are described in Chapters 2 and 3. The Large  
115 Hadron Collider and the ATLAS detector are presented in Chapters 4 and 5. Chap-  
116 ter 5 provides a detailed description of Recursive Jigsaw Reconstruction, as well as  
117 a description of the variables used for the particular search presented in this thesis.  
118 Chapter 6 presents the details of the analysis, including the dataset, object recon-  
119 struction, and selections used by the analysis. In Chapter 7, the final results are  
120 presented; since there is no evidence of a supersymmetric signal in the analysis, we  
121 present the final exclusion curves in simplified supersymmetric models.

## Chapter 2

123

---

### *The Standard Model*

124 Here you can write some introductory remarks about your chapter. I like to give each  
125 sentence its own line.

126 When you need a new paragraph, just skip an extra line.

## 127 **2.1 Quantum Field Theory**

## 128 **2.2 Symmetries**

## 129 **2.3 The Standard Model**

### 130 **Overview**

131 By using the asterisk to start a new section, I keep the section from appearing in the  
132 table of contents. If you want your sections to be numbered and to appear in the  
133 table of contents, remove the asterisk.

### 134 **Fermions**

135 By using the asterisk to start a new section, I keep the section from appearing in the  
136 table of contents. If you want your sections to be numbered and to appear in the  
137 table of contents, remove the asterisk.

## 138 **Bosons**

139 By using the asterisk to start a new section, I keep the section from appearing in the  
140 table of contents. If you want your sections to be numbered and to appear in the  
141 table of contents, remove the asterisk.

## 142 **2.4 Electroweak Symmetry breaking**

143 By using the asterisk to start a new section, I keep the section from appearing in the  
144 table of contents. If you want your sections to be numbered and to appear in the  
145 table of contents, remove the asterisk.

## 146 **2.5 Deficiencies of the Standard Model**

147 By using the asterisk to start a new section, I keep the section from appearing in the  
148 table of contents. If you want your sections to be numbered and to appear in the  
149 table of contents, remove the asterisk.

150

## Chapter 3

151

---

### *Supersymmetry*

152 Here you can write some introductory remarks about your chapter. I like to give each  
153 sentence its own line.

154     When you need a new paragraph, just skip an extra line.

### 155 **3.1 Motivation**

156 **Only Additional allowed Lorentz invariant symmetry**

157 **Dark Matter**

158 **Cancellation of quadratic divergences in corrections to the**

159 **Higgs Mass**

### 160 **3.2 Supersymmetry**

### 161 **3.3 Additional particle content**

### 162 **3.4 Phenomenology**

163 **R parity Consequences for sq/gl decays**

164

## Chapter 4

165

---

### *The Large Hadron Collider*

166 Here you can write some introductory remarks about your chapter. I like to give each  
167 sentence its own line.

168     When you need a new paragraph, just skip an extra line.

#### 169 **4.1 Magnets**

170 By using the asterisk to start a new section, I keep the section from appearing in the  
171 table of contents. If you want your sections to be numbered and to appear in the  
172 table of contents, remove the asterisk.

173

## Chapter 5

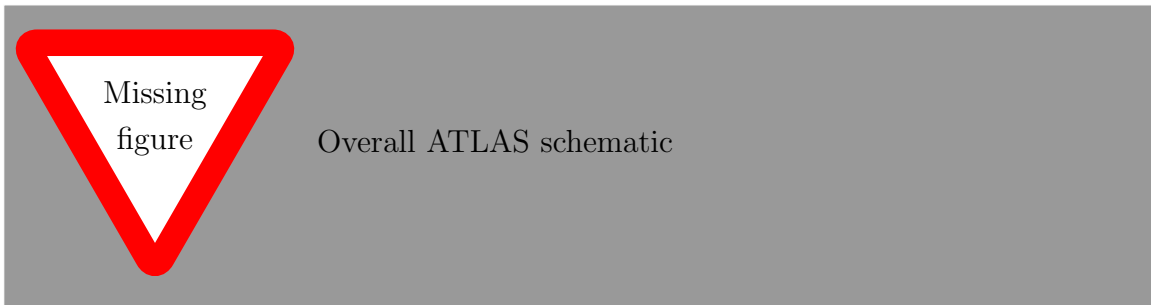

174

---

### *The ATLAS detector*

175 Here you can write some introductory remarks about your chapter. I like to give each  
176 sentence its own line.

177 When you need a new paragraph, just skip an extra line.

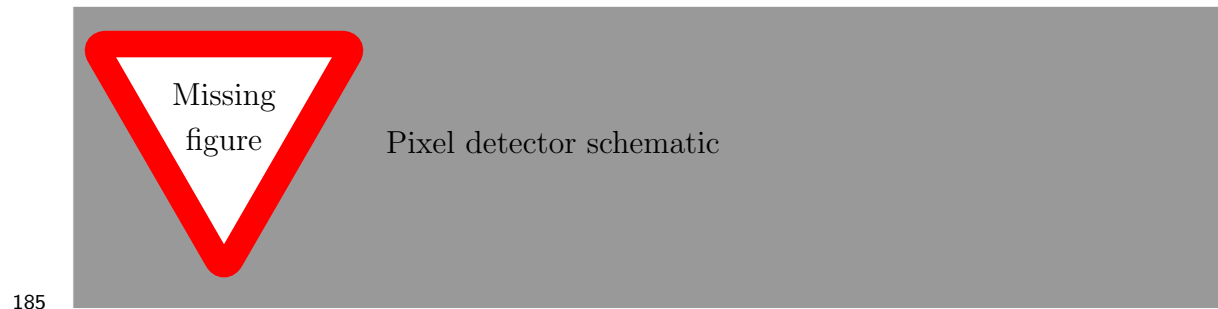

178

179

## 180 **5.1 Inner Detector**

181 By using the asterisk to start a new section, I keep the section from appearing in the  
182 table of contents. If you want your sections to be numbered and to appear in the  
183 table of contents, remove the asterisk.

184 **Pixel Detector**

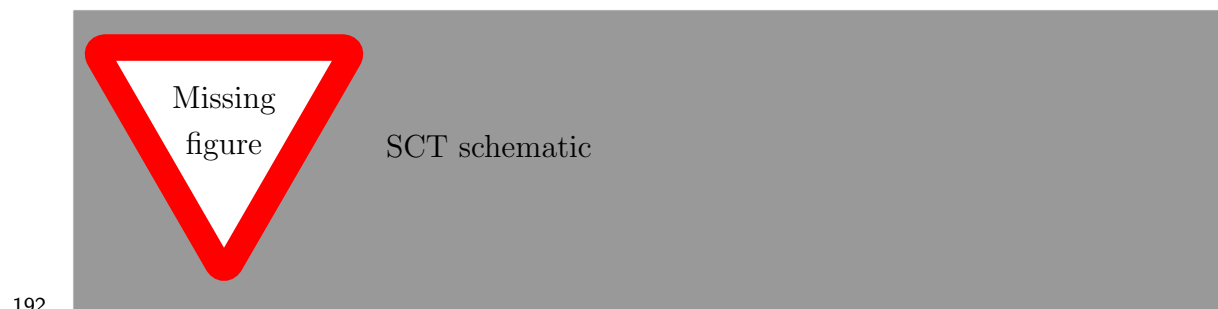

187 **Insertable B-Layer**

188 Qualification task, so add a bit more.

191 **Semiconductor Tracker**

194 **Transition Radiation Tracker**

197 **5.2 Calorimeter**

200 **Electromagnetic Calorimeter**

201 **Hadronic Calorimeter**

202 **5.3 Muon Spectrometer**

205

## Chapter 6

206

---

### *The Recursive Jigsaw Technique*

207 Here you can write some introductory remarks about your chapter. I like to give each  
208 sentence its own line.

209 When you need a new paragraph, just skip an extra line.

#### 210 **6.1 Razor variables**

211 By using the asterisk to start a new section, I keep the section from appearing in the  
212 table of contents. If you want your sections to be numbered and to appear in the  
213 table of contents, remove the asterisk.

#### 214 **6.2 SuperRazor variables**

#### 215 **6.3 The Recursive Jigsaw Technique**

#### 216 **6.4 Variables used in the search for zero lepton**

#### 217 **SUSY**

---

*Title of Chapter 1*

220

## Chapter 8

221

---

### *Title of Chapter 1*

222 Here you can write some introductory remarks about your chapter. I like to give each  
223 sentence its own line.

224 When you need a new paragraph, just skip an extra line.

## 225 **8.1 Object reconstruction**

### 226 **Photons, Muons, and Electrons**

### 227 **Jets**

### 228 **Missing transverse momentum**

229 Probably longer, show some plots from the PUB note that we worked on

## 230 **8.2 Signal regions**

231 **Gluino signal regions**

232 **Squark signal regions**

233 **Compressed signal regions**

## 234 **8.3 Background estimation**

235 **Z  $\nu\nu$**

236 **W  $e\nu$**

237  **$t\bar{t}$ bar**

238

## Chapter 9

239

---

### *Title of Chapter 1*

240 Here you can write some introductory remarks about your chapter. I like to give each  
241 sentence its own line.

242     When you need a new paragraph, just skip an extra line.

### 243 **9.1 Statistical Analysis**

244 maybe to be moved to an appendix

### 245 **9.2 Signal Region distributions**

### 246 **9.3 Pull Plots**

### 247 **9.4 Systematic Uncertainties**

### 248 **9.5 Exclusion plots**

249

---

## *Conclusion*

250 Here you can write some introductory remarks about your chapter. I like to give each  
251 sentence its own line.

252     When you need a new paragraph, just skip an extra line.

## 253 **9.6   New Section**

254 By using the asterisk to start a new section, I keep the section from appearing in the  
255 table of contents. If you want your sections to be numbered and to appear in the  
256 table of contents, remove the asterisk.
